

## WAVELENGTH ROUTER WITH STAGGERED INPUT/OUTPUT FIBERS

### ABSTRACT OF THE DISCLOSURE

An optical routing apparatus and method that achieves improved optical signal  
5 reintegration is disclosed. The optical routing apparatus includes an input port, such as may  
be provided at the end of an optical fiber. The signal may be routed to one or more of a  
plurality of output ports, such as may also be provided at the end of an optical fiber, each  
output port being configured to receive the optical signal. The routing between the input port  
10 and the output ports is accomplished with an optical switching arrangement that may shift  
among multiple distinct optical configurations, each configuration being such as to direct the  
optical signal to one of the output ports. The ports are positioned such that the input port and  
at least one of the output ports lie in different parallel planes, each such plane being  
orthogonal to a path along which the optical signal is provided by the input port or received  
15 by one of the output ports.
